1 Problem Statement

CSIR UGC NET Dec 2012 Q60

Men arrive in a queue according to a Poisson process with rate λ_1 and women arrive in the same queue according to another Poisson process with rate λ_2 . The arrivals of men and women are independent. The probability that the first person to arrive in the queue is a man is:

1. $\frac{\lambda_1}{\lambda_1 + \lambda_2}$
2. $\frac{\lambda_2}{\lambda_1 + \lambda_2}$
3. $\frac{\lambda_1}{\lambda_2}$
4. $\frac{\lambda_2}{\lambda_1}$

2 Solution

Let X and Y be Poisson random variables, with the values X takes being the number of men joining the queue in an arbitrary time t , and the values Y takes being the number of women joining the queue in an arbitrary time t .

$$Pr(X = i) = \frac{\lambda_1^i \cdot e^{-\lambda_1}}{i!} \quad (2.0.1)$$

$$Pr(Y = i) = \frac{\lambda_2^i \cdot e^{-\lambda_2}}{i!} \quad (2.0.2)$$

For 2 independent Poisson distributions with means λ_1 and λ_2 , the simultaneous distribution can be represented by:

$$Pr(X + Y = i) = \frac{(\lambda_1 + \lambda_2)^i \cdot e^{-(\lambda_1 + \lambda_2)}}{i!} \quad (2.0.3)$$

Now we take conditional probability that if only one person entered the queue within a certain time t , then the probability of them being a man and not a woman is given by:

$$Pr(X = 1 | (X + Y) = 1) = \frac{Pr((X = 1) + (Y = 0))}{Pr(X + Y = 1)} \quad (2.0.4)$$
$$(2.0.5)$$

Since X and Y are independent,

$$Pr(X = 1 | (X + Y) = 1) = \frac{Pr(X = 1) \cdot Pr(Y = 0)}{Pr(X + Y = 1)} \quad (2.0.6)$$

$$= \frac{\frac{\lambda_1^1 \cdot e^{-\lambda_1}}{1!} \cdot \frac{\lambda_2^0 \cdot e^{-\lambda_2}}{0!}}{\frac{(\lambda_1 + \lambda_2)^1 \cdot e^{-(\lambda_1 + \lambda_2)}}{1!}} \quad (2.0.7)$$

$$= \frac{\lambda_1}{\lambda_1 + \lambda_2} \quad (2.0.8)$$

The probability that the first person to arrive in the queue is a man is option A, i.e. $\frac{\lambda_1}{\lambda_1 + \lambda_2}$
