1 Problem Statement

A fair coin is tossed 3 times in succession. If the first toss is a head, then the probability of getting exactly two heads in three tosses is?

2 Solution

We can see that if the first toss is guaranteed to be a head, then the problem is reduced to finding the probability of getting one head in 2 coin tosses, since all the 3 trials are independent.

Let $K = \{0, 1, 2\}$ be the random variable denoting the number of heads obtained in 2 tosses of a fair coin. The event can be represented by a binomial distribution $b(n, p)$. In $b(n, p)$, $Pr(K = i) = \binom{n}{i} p^i \cdot (1 - p)^{n-i}$. Here $n = 2$, $p = 0.5$.

We can see that the probability of $K = 1$ is

$$Pr(K = 1) = \binom{2}{1} \cdot 0.5^2 \quad (2.0.1)$$

$$= \frac{1}{2} \quad (2.0.2)$$

From (2.0.1) and (2.0.2), we see that probability of getting exactly 2 heads in 3 tosses, if the first toss is a head, is 0.5.
